Note: Here flag is given but you should not copy flag from here just find one by following steps mentioned here.

Question: This vault uses some complicated arrays! I hope you can make sense of it, special agent. The source code for this vault is here:

VaultDoor1.java

Approach: We solved a problem similar to this earlier where we needed to derive the password for the vault door to open. This is a similar problem but with improved security.

On checking the attached code, we can find the checkPassword function and on reversing it, we can derive the password.

```
public boolean checkPassword(String password) {  
    return password.length() == 32 &&  
        password.charAt(0) == 'd' &&  
        password.charAt(29) == 'a' &&  
        password.charAt(4) == 'r' &&  
        password.charAt(2) == '5' &&  
        password.charAt(23) == 'r' &&  
        password.charAt(3) == 'c' &&  
        password.charAt(17) == '4' &&  
        password.charAt(1) == '3' &&  
        password.charAt(7) == 'b' &&  
        password.charAt(10) == '_' &&  
        password.charAt(5) == '4' &&  
        password.charAt(9) == '3' &&  
        password.charAt(11) == 't' &&  
        password.charAt(15) == 'c' &&  
        password.charAt(8) == 'l' &&  
        password.charAt(12) == 'H' &&  
        password.charAt(20) == 'c' &&  
        password.charAt(14) == '_' &&  
        password.charAt(6) == 'm' &&  
        password.charAt(24) == '5' &&  
        password.charAt(18) == 'r' &&  
        password.charAt(13) == '3' &&  
        password.charAt(19) == '4' &&  
        password.charAt(21) == 'T' &&  
        password.charAt(16) == 'H' &&  
        password.charAt(27) == '6' &&  
        password.charAt(30) == 'f' &&  
}
```

It is a simple function that checks a particular character. What we need to do is that we must rearrange all the character in order and then we will have the flag.

On ordering them, we have our string. Combining it with picoCTF{}, we have our flag.

Flag: picoCTF{d35cr4mbl3_tH3_cH4r4cT3r5_03f841}
